

Introduction

Legrand, a clear, comprehensive offer for all types of application

DX ${ }^{3}$, a complete solution

## DX ${ }^{3}$

THE NEXT STEP

Easy, safe connection

$D X^{3}$, impeccable quality

Perfect control of your installation

Protection tailored
to your requirements

Choose your distribution

More comfort with energy saving

Catalogue pages

A company always known for its groundbreaking innovations, Legrand's extensive R\&D and technologically advanced products make us who we are today. As the global specialist in electrical and digital building infrastructures, our understanding of the market and its needs motivate us to innovate. Your recognition of our efforts, led us to the next step - $\mathrm{DX}^{3}$.

Presenting, $\mathrm{DX}^{3}$, an international range of protection devices. Its revolutionary design supports all kinds of installations thus giving a never before experience. With 10 patents, 13 new features and a wide range, $\mathrm{DX}^{3}$ is the next step.

## $\square$ legrand

## LEGRAND, A CLEAR, COMPREHENSIVE OFFER FOR ALL TYPES OF APPLICATION

The new DX ${ }^{3}$ circuit breakers can be integrated with a wide range of products, providing exceptional technical performance levels

The variety of functions and range of characteristics offered will enable you to equip all your distribution boards. The very high levels of coordination between the various ranges of $\mathrm{DX}^{3}$ modular circuit breakers makes it suitable for all types of application.

PROTECTION / BREAKING

All functions on DIN rail

## 17 legrand

Each breaking capacity has its own power solution Perfect complementarity for your distribution boards up to 6300 A and 100 kA breaking capacity.

DPX ${ }^{3}$

$D M X^{3}$

## Tl legrand

DX ${ }^{3}$

A COMPLETE SOLUTION

The efficient designs of the products are such that they can be easily installed.
The clear identification marks, to know the state of the circuit breaker, make it easier to maintain. The high quality products also assure the safety of the user, thus making it a complete solution.

## EASY, SAFE CONNECTION

Safety is prioritised with the innovative features of the $\mathrm{DX}^{3}$ products

The quality and hold of the connections are vital for the safety of distribution boards fitted with high breaking capacity MCBs. The connection areas are designed to make installation faster without compromising on safety.

RISING CLAMP TERMINALS Ensure a high quality, durable connection

RELIABLE CONNECTIONS
Compensation for the effect of loosening
to ensure excellent hold over time
and consistent contact ( $\mathrm{In} \geq 80 \mathrm{~A}$ )

## 1.5

 modules/poleBlack handle: circuit breakers Grey handle: switches Breaking capacity 16 kA 25 kA 36 kA 50 kA

## RETRACTABLE INSULATING SHIELDS

With the integrated retractable insulating
shields, no additional accessories are
needed to isolate the connections
on any breaking capacities and high ratings
of the 1.5 modules/pole ( $\mathrm{In} \leq 63 \mathrm{~A}$ ) circuit breakers.

Legrand pays particular attention to how these devices perform: Each of them is set and checked individually on the production lines

The design integrated with the $D X^{3}$ range implicates its international quality. The products are crafted in a way to provide ease of installation.

## 41 legrand

## PERFECT CONTROL <br> OF YOUR INSTALLATION

The $D X^{3}$ range
has a selection of electrical auxiliaries for monitoring and controlling circuits remotely

Auxiliary contacts and fault signal contacts, shunt trips, undervoltage releases,
overvoltage releases and motorised controls.

THE AUXILIARIES FIT FIRMLY without the need for any tools and ensures that the entire assembly is robust

THE ACCESSIBILITY OF THE TERMINALS and the visibility of the screw heads make the installer's work easier

$D X^{3}$ motorised controls can be used with 1 module per pole devices (circuit breakers, RCBOs and RCCBs) just as easily as auxiliaries.

## OPTIMISED SPACE IN THE DISTRIBUTION BOARD

Legrand motorised controls are the most compact
in the market: 1 module wide.
They save a great deal of space inside the
distribution board.

## Llegrand

## PROTECTION

TAILORED TO YOUR REQUIREMENTS

A compact solution for protection and measurement

The new $D X^{3}$ RCD add-on modules with metering have a wide range of features to meet the most stringent safety requirements. They come with RS485 communication port for remote data viewer.

## CHOOSE YOUR DISTRIBUTION

Legrand optimised distribution has been designed for maximum safety, ease of installation and maintenance of distribution boards

Wiring and tedious tightening operations are minimised, and the risks of poor contact and short-circuits are reduced, while mounting time is optimised.

DISTRIBUTION BLOCK
SUPPLY VIA THE
POWER SUPPLY MODULE PROVIDED

OPTIMISED
DISTRIBUTION HX ${ }^{3} 125$ A horizontal distribution blocks with plug-in connection

Horizontal 4-pole distribution for $\mathrm{XL}^{3}$ 160 to 4000 enclosures:

- Optimised design:

Freedom to mix 1P, 1P+N, 2P, $3 P$ and 4P devices on the same row

- Optimised installation: Automatic connection with no wiring or clamping
- Safe connection and disconnection of devices, even when the distribution block is powered-up (due to the IP xxB insulation of the distribution block and the integral connection modules in the devices).

## EASY CONNECTION

Circuit breakers with plug-in terminals are fixed onto the distribution block with no need for any tool. The phase to be connected is determined by the choice of the connector. The distribution block can be supplied via the power supply module provided or via the head of row device.

# MORE COMFORT WITH ENERGY SAVINGS 

The Legrand modular control and monitoring devices are a perfect addition to the range of $\mathrm{DX}^{3}$ protection devices

With its time switches \& contactors,
Legrand guarantees a unique experience
With the selection of functions available,
it is simple to improve the safety, efficiency and comfort of installations and meet energy requirements.

- Conform to IEC/EN 61095
- Space for power supply busbar on top (up to 25 A)
- Manuat override for test and repair functions, carried out via the handle
- Permanent "ON" or "OFF" without automatic reset

Battery replacement

- With synchronous (mains- synchronised clock precision) or quartz motor
- +/- $2.5 \mathrm{~s} /$ day clock precision (quartz motor)
- 100 hour running reserve (quartz motor)
- Surface-mounting possible with a wall bracket and a terminal cover (cat no: 412859)
- Unit width: 3 modules of 17.5 mm each

EMDX³ electrical energy meters

004674

Technical characteristics p. 68-69
Measure the electricity consumed by a single-phase or three-phase circuit downstream of the electricity distribution metering
Display electricity consumption in kWh, as well as other values such as current, active energy, reactive energy and power (depending on the catalogue number)
Conform to standards IEC 62053-21/23, IEC 62052-11 and IEC 61010-1
MID compliance ensures accuracy of the metering with a view to recharging for the electricity used

| Pack | Cat.Nos | Single-phase meters <br> Direct connection |

## Lllegrand

## Class I (T1) low voltage SPDs

Technical characteristics p. 70-72

Protection against transient overvoltagess for 230/400 V ~ power networks ( $50 / 60 \mathrm{~Hz}$ ). SPDs compliant with EN/IEC 61643-11 standards Recommended for main distribution boards
Class I+II (T1+T2) : SPDs tested and specified according to both T1 and T2 test classes

## Class II (T2) low voltage SPDs

$\square$ Technical characteristics p. 70-72
Protection against transient overvoltagess for 230/400 V ~ power networks ( $50 / 60 \mathrm{~Hz}$ ). SPDs compliant with EN/IEC 61643-11 standards Recommended for distribution boards

| Pack | Cat.Nos | T2 SPDs |  |  |  |

## Pack

SPDs for telephone and data lines
Overvoltage protection of equipment such as telephones, modems, video door entry phones, RS485 networks, measurement loops, etc. Not compatible with VDSLs
SPDs needed to provide complete protection of the installation when low voltage SPDs are present TS/IEC 61643-12).
SPDs with status indicators:

- Green: SPD operational
- Orange: plug-in module need to be replaced Compliant with EN/IEC 61643-21 standards
"Analogue" SPD (STN, non-unbundled
ADSL, etc.)

"Digital" SPD (unbundled ADSL, SDSL, ISDN, etc.)

| $5 / 10 \mathrm{kA}$ | 48 V | 100 V | 1 |
| :--- | :--- | :--- | :--- |

1: $1 \mathrm{P}+\mathrm{N}$ and $3 \mathrm{P}+\mathrm{N}$ : L-N and N-PE protection modes (common and differential modes), the $N$ pole being protected by encapsulated spark gaps. Also called sometimes $1+1$ and $3+1$

DX ${ }^{3}$
MCBs

## Technical data

| Specifications | IS/IEC 60898-1 2002 |
| :---: | :---: |
| Number of poles | SP, SPN, DP, TP, TPN, FP |
| Characteristics | C \& D Curve |
| Breaking capacity | 10 kA 0.5 A to 63 A as per IS/IEC 60898-1 2002 16 kA for 0.5 A to 25 A as per IEC 60947-2 |
| Rated voltage | $230 \mathrm{~V} / 400 \mathrm{~V}$ |
| Current limitation class | Class 3 |
| Frequency | $50 \mathrm{~Hz} / 60 \mathrm{~Hz}$ |
| Minimum operating voltage | $12 \mathrm{~V} \mathrm{AC/DC}$ |
| Enclosures | Polyester <br> self extinguishing, heat and fire resistant according to IEC 60898-1, glow-wire test at $960^{\circ} \mathrm{C}$ for external parts made of insulating material necessary to retain in position currentcarrying parts and parts of protective circuit $\left(650^{\circ} \mathrm{C}\right.$ for all other external parts made of insulating material) |
| Mounting position | Vertical / Horizontal / Upside down / On the side |
| Fixing | On symmetric rail EN/IEC 60715 or DIN 35 |
| Maximum cable size | Top/Bottom $1 \times 1.5 \mathrm{~mm}^{2}$ to $35 \mathrm{~mm}^{2}$ <br> Rigid cable $2 \times 1.5 \mathrm{~mm}^{2}$ to $16 \mathrm{~mm}^{2}$ |
|  | Top/Bottom $1 \times 1.5 \mathrm{~mm}^{2}$ to $25 \mathrm{~mm}^{2}$ <br> Flexible cable $2 \times 1.5 \mathrm{~mm}^{2}$ to $10 \mathrm{~mm}^{2}$ |
| Applied connection torque | Recommended: 2.5 Nm Minimum : 2 Nm Maximum: 3 Nm |
| Mechanical endurance | 20000 operations without load |
| Electrical endurance | 10000 operations with load (under $\operatorname{In}^{*} \cos \varphi=0.9$ ) 2000 operations under In, DC current |
| Permissible ambient temperature | 0.5 to 63 A - Maximum $+70^{\circ} \mathrm{C}$ Minimum $-25^{\circ} \mathrm{C}$ |
| Specifications | IEC 60947-2 |
| Number of poles | SP, DP, TP, FP |
| Breaking capacity | 10 kA 80 A to 125 A as per IEC 60898 16 kA for 80 A to 125 A as per IEC 60947-2 |
| Rated voltage | $230 \mathrm{~V} / 400 \mathrm{~V}$ |
| Current limitation class | Class 3 |
| Frequency | $50 \mathrm{~Hz} / 60 \mathrm{~Hz}$ |

## Choice of DX ${ }^{3}$ MCBs for capacitor banks

This table shows the rated current of MCBs to be used when controlling capacitor banks so as to guarantee its function and shortcircuit protection.
Overload protection is not necessary since these installations cannot be overloaded.
This data refers to shortcircuit protection in absence of harmonics or heavy transitory currents.

| Power of capacitor bank in kVAr | DX ${ }^{3}$ MCB rating in amps |  |  |  |

## Derating of MCB for use with fluorescent lights

Ferromagnetic and electronic ballasts have a high inrush current for a short time. These currents can cause the tripping of circuit breakers. At the time of the installation, it should take into account the maximum number of ballasts per circuit breaker that the manufacturers of lamps and ballasts indicate in their catalogues.

## Influence of the altitude

|  | $\leq \mathbf{2 0 0 0} \mathbf{~ m}$ | $\mathbf{3 0 0 0} \mathbf{~ m}$ | $\mathbf{4 0 0 0} \mathbf{~ m}$ | $\mathbf{5 0 0 0} \mathbf{~ m}$ |
| :--- | :---: | :---: | :---: | :---: |
| Dielectric holding | 3000 V | 2500 V | 2000 V | 1500 V |
| Max operational voltage | 400 V | 400 V | 400 V | 400 V |
| Derating at $\mathbf{3 0 ^ { \circ } \mathbf { C }}$ | none | none | none | none |

## Derating of MCBs function of the number of devices side by side:

When several MCBs are juxtaposed and operate simultaneously, the thermal evacuation of the poles is limited. This results in an increase in operating temperature of the circuit breakers which can cause unwanted tripping. It is recommended to apply the following coefficients to the rated currents.

## Influence of the altitude

| Number of circuit breakers side by side |
| :--- |
| $2-3$ |
| $4-5$ |
| $6-9$ |
| 10 |$\quad 0.9$

## Tripping characteristics

Standards has established different tripping characteristics depending on minimum and maximum values of magnetic trip.

| DX ${ }^{3}$ MCB | Type | Im1 | Im2 | Typical application |

## Association of protection devices

Association is the technique by which the breaking capacity of a MCB is increased by coordinating it with another protection device, placed upstream. This coordination makes it possible to use a protection device with a breaking capacity which is lower than the maximum prospective short-circuit current at its installation point
The breaking capacity of a protection device must be at least equal to the maximum short-circuit which may occur at the point at which this device is installed
In exceptional cases, the breaking capacity may be lower than the maximum prospective short-circuit, as long as:

- It is associated with a device upstream which has the necessary breaking capacity at its own installation point
- The downstream device and the trunking being protected can withstand the power limited by the association of the devices.
Association therefore leads to substantial savings.
The association values given in the tables on the following pages are based on laboratory tests carried out in accordance with IEC 60947-2.

Note: In the case of single phase circuits (protected by $\mathrm{P}+\mathrm{N}$ or 2 P MCBs ) in a 415 V AC supply, supplied upstream by a 3-phase circuit, it is advisable to use the association tables for 230 V .

Example of association

## 3-level association

An association may be created on three levels if one of the conditions below is met.

- The upstream device A must have an adequate breaking capacity at its installation point. Devices B and C are associated with device A. Simply check that the association values $B+A$ and $C+A$ have the necessary breaking capacity.
In this case, there is no need to check the association between devices B and C .
- The association is made between successive devices: Upstream device A, which has an adequate breaking capacity at its installation point, device $C$ is associated with device B which is in turn associated with
 device A.
Simply check that the association values C+B and $B+A$ have the necessary breaking capacity. In this case, there is no need to check the association between devices $A$ and $C$.

## Association in IT connection systems

The values given in the tables should only be used for TN and TT systems.
Although this practice is not widely used, these values may also be used for installations with IT systems. It is therefore advisable to check that each protection device, on its own, can break, on a single pole, the maximum double fault current at the point in question.

## Association between distribution boards

Association applies to devices installed in the same distribution board as well as in different boards. It is therefore generally possible to benefit from the advantages of the association between devices located, for example, in a main distribution board and in a secondary ooard.

## MCB - switch association

The switches must be systematically protected by an MCB placed upstream. There is considered to be protection against overloads if the rating of switch I is at least equal to that of the upstream MCB, D. If this is not the case, the thermal stresses (devices and conductors) must be checked. The tables on the following pages give the breaking capacity limits of the MCB - switch associations.

## Discrimination of protection devices

Discrimination is a technique which consists of coordinating the protection in such a way that a fault on one circuit only trips the protection placed at the head of that circuit, thus avoiding rendering the remainder of the installation inoperative. Discrimination improves continuity of service and safety of the installation
Discrimination rules are set by the regulations concerning public buildings and for safety installations in general.

Discrimination between $A$ and $B$ is said to be "total" if it is provided up to the value of the maximum prospective short-circuit at the point at which B is installed.

By extension, in the tables on the following pages, total discrimination, indicated by T, means that there is discrimination up to the breaking capacity of device B.
Discrimination between $A$ and $B$ is said to be "partial" in the other cases.
The discrimination limit (given in the following tables) is therefore defined. This gives the short-circuit current value below which only MCB B will open and above which MCB A will also open.
There are a number of techniques for providing discrimination:

- Current discrimination, used for terminal circuits which have low shortcircuits.
- Time discrimination, provided by a delay on tripping the upstream MCB
- Logical discrimination, a variant of time discrimination, used on electronic MCBs via a special link between the devices.

Since almost all faults occur during use, partial discrimination may be adequate if the discrimination limit is higher than the value of the maximum short-circuit which may occur at the point of use (or at the end of the trunking). This is referred to as "operating discrimination". This technique is very often adequate, more economical and less restricting in terms of implementation.
The discrimination limit for the association DPX 250 ER ( 160 A) with Lexic MCB 40 A (C curve) is 6 kA. Since the prospective ISC at the point of installation is 8 kA , the discrimination is not total. However, there is discrimination at the point of use at which the prospective short-circuit is only 3 kA .

## Current discrimination

This technique is based on the offset of the intensity of the tripping curves of the upstream and downstream MCBs. It is checked by comparing these curves and checking that they do not overlap. It applies for the overload zone and the short-circuit zone, and the further apart the ratings of the devices, the better the discrimination.

- On overloads

To have discrimination in the overload zone, the ratio of the setting currents (Ir) must be at least 2.

- On short-circuits

To have discrimination in the short circuit zone, the ratio of the magnetic setting currents (Im) must be at least 1.5.
The discrimination limit is then equal to the magnetic release current ImA of the upstream MCB. The discrimination is then total as long as IscB is less than $\operatorname{ImA}$.
Current discrimination is therefore very suitable for terminal circuits where the short-circuits are relatively weak.
In other cases, time discrimination may be used together with current discrimination.

## Current discrimination

The discrimination is total for $\mathrm{ISC}_{\mathrm{B}}$

$I_{\mathrm{SC}_{\mathrm{B}}}$ : maximum short-circuit at the point at which MCB B is installed
When the downstream MCB B is a limiting device, the short-circuit current is limited in terms of time and amplitude. The discrimination is therefore total if the limited current IscB, which device B allows to pass, is lower than the tripping current of device $A$

$\mathrm{I}_{\mathrm{SC}_{\mathrm{B}}}$ : prospective short-circuit at the point at which the device is installed
$I^{\prime} \mathrm{sc}_{\mathrm{B}}$ : short-circuit limited by device B

## Time discrimination

This technique is based on the offset of the times of the tripping curves of the MCBs in series. It is checked by comparing the curves and is used for discrimination in the short-circuit zone. It is also used in addition to current discrimination in order to obtain discrimination beyond the magnetic setting current of the upstream MCB (ImA).

The following is necessary:

- It must be possible to set a time delay
on the upstream MCB
- The upstream MCB must be able to withstand the short-circuit current and its effects for the whole period of the time delay
- The trunking through which this current passes must be able to withstand the thermal stresses $\left(I^{2} t\right)$.
The non-tripping time of the upstream device must be longer than the breaking time (including any time delay) of the downstream device.
DPX MCBs have a number of time delay setting positions for creating discrimination with a number of stages.

All these values are also valid for circuit breakers associated to differential blocks.
According to the curves and ratings of circuit breakers, attention to the magnetic (or electronic) threshold and to the size of upstream circuit breakers which must necessarily be higher.

## Selectivity between two levels of protection

- The downstream circuit breaker must always have a magnetic threshold and a rated current lower than those of the upstream protection.
- Selectivity is indicated total (T) if there is selectivity up to the value of breaking capacity (according to IEC / EN 60947-2) of the downstream circuit breaker.

## Selectivity between modular circuits breakers and fuses:

- Selectivity limit at 400 V : values in Ampere.

DX ${ }^{3}$ MCBs (10 kA) and RCBOs 3 phase motor application

| Motor <br> H.P. | KW | MCB rating (A) |  |
| :---: | :---: | :---: | :---: |
|  |  | Star Delta | DOL |
| 1 | 0.75 | - | 1.6 A |
| 1.5 | 1.10 | - | 2 A |
| 2 | 1.50 | - | 3 A |
| 3 | 2.25 | - | 4 A |
| 4 | 3.00 | - | 10 A |
| 5 | 3.75 | 10 A | 10 A |
| 6 | 4.50 | 10 A | 10 A |
| 7.5 | 5.50 | 16 A | 16 A |
| 10 | 7.50 | 16 A | 20 A |
| 12.5 | 9.30 | 20 A | 25 A |
| 15 | 11.00 | 25 A | 32 A |
| 17.5 | 13.00 | 25 A | 32 A |
| 20 | 15.00 | 40 A | 40 A |
| 25 | 18.50 | 40 A | 50 A |
| 30 | 22.50 | 50 A | 63 A |
| 35 | 26.00 | 63 A | - |

## For MCB/RCBO ratings :

Single phase $=\mathrm{P}=\mathrm{VI}$
Three phase $\quad=P=\sqrt{3} \mathrm{VI} \operatorname{Cos} \varphi=1.732 \times \mathrm{VI} \times 0.8$
Note : One lighting circuit can have upto 800 W or upto 10 points.
One power circuit can have upto 3000 W or upto 2 power points.
The data given above is only for guidance
The exact rating must be selected only after considering the motor characteristics.

## Technical data

## Isolators

| Specifications | IEC 60947-3 |  |
| :---: | :---: | :---: |
| Number of poles | DP, TP, FP |  |
| Utilization category | AC22A |  |
| Rated operational voltage and frequency | $415 \mathrm{~V}, 50 / 60 \mathrm{~Hz}$ |  |
| Insulation voltage Ui | 500 V AC |  |
| Impulse voltage Uimp | 6 kV |  |
| Short circuit making capacity Icm | 1000 A |  |
| Endurance | Electrical - 1500 operations with load AC22A Mechanical - 10000 operation |  |
| Mounting position | Vertical / Horizontal / Upside down / On the side |  |
| Fixing | On symmetric rail EN/IEC 60715 or DIN 35 |  |
| Maximum cable size | Top/Bottom | $1 \times 1.5 \mathrm{~mm}^{2}$ to $35 \mathrm{~mm}^{2}$ |
|  | Rigid cable | $2 \times 1.5 \mathrm{~mm}^{2}$ to $16 \mathrm{~mm}^{2}$ |
|  | Top/Bottom | $1 \times 1.5 \mathrm{~mm}^{2}$ to $25 \mathrm{~mm}^{2}$ |
|  | Flexible cable | $2 \times 1.5 \mathrm{~mm}^{2}$ to $10 \mathrm{~mm}^{2}$ |
| Applied connection torque | Recommended: 3 Nm Minimum : 2 Nm Maximum: 3.5 Nm |  |
| Permissible ambient temperature | Maximum $+70^{\circ} \mathrm{C}$ Minimum $-25^{\circ} \mathrm{C}$ |  |

## Nature and consequences of electrical risks

## Direct and indirect contact

All electrical risks for people are the result of direct or indirect contact. What are these contacts? And how can we protect ourselves against

All the answers appear in the following section.
Electrical risks do not just concern people : these risks - especially fire affect installations as well. A 500 mA current, for example, flowing through combustible material is sufficient to ignite such material after a certain time. Every electrical installation is subject to current leakages which can vary considerably depending on such factors as the installation's condition, age, environment, etc.
These current leaks may flow through the fabric of the building (trunking, metal girders or other metal components), generating heat which in turn may lead to fire.

## Direct contacts

Direct contact is caused by humans and may be due to either carelessness or clumsiness.

## What is a direct contact? How can we protect ourselves?

## Here are the answers...

This is when someone makes contact with a live electrical component of a device or installation.
For example :

- a person inadvertently touching a live cable.
- a child sticking a metal object into a power socket.
- using male/male extensions or unprotected test cables.

In this case only basic protection is effective

## Other examples

Someone touching a live busbar in a distribution panel or cabinet, or someone touching flush-mounted electrical trunking with the end of a tool, etc. In this case basic protection plus additional protection is effective.

## How can we protect ourselves?

There are two ways (independent of the neutral earthing system) of ensuring that personnel are protected against direct contact.

## - Preventing access to live parts where possible.

Basic protection via physical or electrical isolation of live parts.
This protection must ensure that live parts cannot be touched, even inadvertently.
How?
By using barriers, enclosures, closed cabinets which physically or electrically isolate live parts presenting a danger to the user, shuttered sockets, or insulation.

## - Additional protection

Must be provided by a 30-mA residual current device such as Lexic range of residual current devices. This protection is required in case the basic protection detailed above fails.

## Technical data

## Indirect contacts

Indirect contacts are independent of humans : it results from an internal hardware fault.

## What is an indirect contact?

How can we protect ourselves? Here are the answers...

## What is an indirect contact?

This is when a person makes contact with a metal earthed part which has accidentally been powered up following an insulation fault. This type of contact is very dangerous as, unlike direct contact, it is completely unexpected. For example, a person touching the metal frame of an electrical appliance which has defective insulation may be electrocuted through no fault of their own if the appliance is not protected.

## How can we protect ourselves?

There are three possibilities :

- Preventing access to potentially dangerous metal components via class II protection.
- Good connection of all exposed conductive parts to an effective earth.
- A protective RCD according to the neutral earthing system.

A person is in danger of electrocution if the fault current raises the voltage of the accessible metal part above 50 V to earth.

## Important note:

Under the Indian Electricity Rules [rules 61 (A), 71 (1) and 73 (1)], installation of an RCCB is mandatory in all installations of 5 KW and above, in all luminous tube signs and X-ray installations. The bureau of Indian standards recommends that RCCBs installed at construction sites, temporary installations, agriculture and horticulture premises, limit the residual current to 30 mA .

## Residual current devices, selection and operation

The main function of a residual current device is to ensure that people are protected from any risk of electrocution. It can also ensure protection against risk of fire.
What is the nature of these risks ? What are the consequences? Here are the answers...

## Risks of electrocution-

The dangerous effects of electricity depend on two factors-:

- the flowing time through the human body
- the current value

These two factors are independent and the importance of the risk varies in accordance with the level of each factor.
The dangerous current value through a human body depends on the touch voltage and touch resistance of the human body.
In practice, the current value is defined using a standard "safety" voltage of 50 V . This voltage takes into account the maximum current which can be withstood by a human being with a minimum internal electrical resistance in given conditions. It also takes into account the maximum permissible time for the current to pass through the body without dangerous physio-pathological effects.
50 V is considered as the safe limit of voltage for human body in dry condition.

## How does an electrical current affect the human body?

When subject to a voltage, the human body reacts like any other receiver with a given internal resistance. An electrical current passes through the body with three serious risks :

- Locking of the muscles, or tetanisation : the muscles through which the current passes contract and remain contracted: if this includes the rib cage, breathing may be impeded.
- Action on the heart : the cardiac rhythm is completely disrupted (ventricular fibrillation).
- Thermal effects may cause varying levels of damage to body tissue, including severe burns in the case of very high currents.

Examples of electrocution by direct or indirect contact.

## 17 legrand

DX ${ }^{3}$
RCDs (continued)

## Technical data

## Effect of current on human body

The standards define the following curves, which take into account the two parameters required to assess the risk :

is : current flowing through body.
t : time taken for current to pass through body.
These curves show the various zones of effect of an alternating current on people : they derive from IEC 60479 and determine

## 4 main risk zones

| Zone <br> designation | Physiological effects |
| :--- | :--- |
| zone AC-1 | Usually no reaction |
| zone AC-2 | Usually no harmful physiological effects |
| zone AC-3 | Usually no organic damage to be expected. Likelihood of cramp like <br> muscular contractions and difficulty in breathing for durations of current- <br> flow longer than 2 s. Reversible disturbances of formation and conduction of <br> impulses in the heart, including atrial fibrillation and transient cardiac arrest <br> without ventricular fibrillation increasing with current magnitude and time |
| zone AC-4 | Increasing with magnitude and time, dangerous pathophysiological effects <br> such as cardiac arrest, breathing arrest and serious burns may occur in <br> addition to the effects of zone-3 |
| zone AC-4.1 | Probability of ventricular fibrillation increasing up to about 5\% |
| zone AC-4.2 | Probability of ventricular fibrillation up to about 50\% |
| Zone AC-4.3 - C2 | Probability of ventricular fibrillation above 50\% |

* For durations of current flow below 10 ms , the limit for the body current at line b remains constant at a value of 200 mA .

A residual current device continuously measures the difference between the value of the input and the output currents. If the value is not equal to zero, this indicates a leak.
When this leak reaches the level at which the differential is set (its sensitivity), the device trips and breaks the circuit.
What are the operating principles of a residual current device?
What are the selection criteria for a residual current device? Here are the answers...

Operating principle of a residual current device

## No fault present

Therefore no current is induced in coil $K_{1}$, and coil $\mathrm{K}_{2}$ is not excited. The contacts do not open. The equipment operates normally
$I_{f}=0$, thus
$l_{1}=I_{2}$
$\varnothing_{1}=\varnothing_{2}$
$\varnothing_{1}-\varnothing_{2}=0$

## Insulation fault

## Selecting a residual current device

First determine your requirement. This exists on two levels :
1 The need to protect against direct or indirect contacts.
2 The need to ensure protection against overloads and short-circuits. If protection against indirect contact is required, use residual current devices with a sensitivity of : 30 mA ,

$$
\begin{aligned}
& 100 \mathrm{~mA}, \\
& 300 \mathrm{~mA},
\end{aligned}
$$

The rating ( $40,63 \mathrm{~A}$, etc.) is selected according to the load. If protection against direct contact is required, use residual current device with a sensitivity of 30 mA .
The sensitivity of a residual current device $I \Delta n$ is the current level at which tripping is sure to occur. To do this, the standards concerning residual current devices stipulate that tripping must occur between $\mathrm{I} \Delta \mathrm{n} / 2$ and l n .

## RCDs (continued)

## Technical data

## Types of residual current device

There are 2 types of RCD : the AC type and the A type
Both types are produced in the "S" (discriminating) or normal versions.
They conform to Indian and International standards IS 12640,
IEC 61008 and IEC 61009 as well as European standards EN 61008 and EN 61009.

## - Type A

Sensitive to residual alternating currents and residual currents with a
DC component.
Use : special applications

- if it is possible that the fault currents are not purely sinusoidal (rectifier bridge, etc.)
- Type AC

Sensitive to residual alternating currents
Use : standard applications

- Type S S

Delayed trip for discrimination with other residual current devices. Use : for discrimination with a downstream device.

- Type Hpi $\sim \sim \mathrm{Hpi} \underset{\mathcal{X}_{-25}^{*}}{\sim}$
- Enhanced immunity to unwanted tripping in environments with disturbances. eg. diesels, computers, printers, etc.
- Detects faults with DC components eg. thyristors, trio etc.

## Residual current circuit-breaker with or without overload

 protection? Which do I choose?Choose a residual current circuit-breaker (RCCB) if you do not need to protect against overload and short circuits (caution! an RCCB must be connected to some form of line protection device : either a circuitbreaker or a fuse).
Choose a residual current circuit-breaker with overload and short circuit protection (RCBO) if this type of protection is not available.

Residual current circuit-breakers without overload and short circuit protection (RCCB)

These provide three functions : fault current detection, measurement and cut-off : protection against overloads and shortcircuits : and isolation of an installation.
Residual current circuit-breakers are governed by standards IS 12640 (part 2), IEC 61009-1.

## The "test" function

A residual current device is a safety device, and it is therefore vital that it is regularly tested. This function is therefore required by the standard governing residual current protective devices, and ensures correct operation. All Lexic RCDs are equipped with this function.

Note: We offer Type AC, Type A-S and Type Hpi RCDs

## Compatibility MCBs/add-on modules

| Breaking capacity | Number of poles | Add-on module for 1.5 module/pole MCBs |
| :---: | :---: | :---: |
| 16 kA | 2P, 4P | $\mathrm{ln} \geq 80 \mathrm{~A}$ |
| 25 kA | 4P | In $\geq 32 \mathrm{~A}$ |
|  | 2 P | $\mathrm{ln} \geq 40 \mathrm{~A}$ |
|  | 4 P | In $\geq 12,5 \mathrm{~A}$ |
|  | 2P | In $\geq 32 \mathrm{~A}$ |
| 50 kA | 2P, 4P | All range |

## L7 legrand

## STOP\&GO automatic resetting for DX ${ }^{3}$

## Performance of MCBs and auxiliaries

## Operating principle

Temporarily electrical disturbances and other external events can cause unwanted tripping of different devices protecting electrical installation

STOP\&GO verifies automatically the state of the installation, before resetting and launches a visual and close a contact in case of permanent fault detection (short-circuit or residual current)

After verifying the state of the installation, STOP\&GO automatic resets the associated protection device in order to immediatly re-establish power supply and avoid unwanted consequences

STOP\&GO does not protect the installation against lightning strikes For an efficient protection against lightning, use voltage surge protectors
The Autotest version is specially suitable for installations equipped with residual current protection devices (RCD's and RCBOs)
STOP\&GO periodically does an automatic test of the functionning of residual current protection devices. The manual test is no longer needed

Installation without STOP\&GO

Mains fault due to temporarily electrical disturbances
Electrical devices are not powered anymore

Installation with STOP\&GO

STOP\&GO automatic resets the associated protection device in order to immediatly re-establish power supply

## Performance of MCBs and auxiliaries

## Electric wiring diagram

## Cat.No 406286

## Tripping time:

Limit values of breaking time and non actuation time at a voltage

|  | $\mathbf{2 5 5} \mathbf{V}$ | $\mathbf{2 7 5} \mathbf{V}$ | $\mathbf{3 0 0} \mathbf{V}$ | $\mathbf{3 5 0} \mathbf{V}$ | $\mathbf{4 0 0} \mathbf{~ V}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Breaking time | No <br> tripping | 15 Sec | 5 Sec | 0.75 Sec | 0.20 Sec |
|  |  | 1 Sec | 0.25 Sec | 0.07 Sec |  |

## Combinations with auxiliaries:

## Protection of DC circuits

## Protection of DC circuits

DX 3000 and DX 310000 MCBs (1P/2P/3P/4P - In $\leq 63$ A) designed for use in 230/400 V $\sim$ supplies, can also be used in DC circuits In this case, the following deratings and precautions must be taken into account

## 1 - Protection against short-circuits

Max. magnetic tripping threshold: multiplied by 1.4
Example: For a C curve MCB for which the AC tripping threshold is between 5 and 10 In , the DC tripping threshold will be between 7 and 14 In

## 2 - Protection against overloads

The time/current thermal tripping curve is the same as for AC

## 3 - Operating voltage

Max. operating voltage: 80 V per pole ( 60 V for single-pole + N MCBs) For voltages higher than this value, several poles must be wired in series

## 4 - Breaking capacity

4000 A for a single pole MCB at max. voltage ( 80 V =. per pole)
For other voltages, the breaking capacities are as follows:

| DX ${ }^{3} 6000$ |  | voltage | single-pole | 2P | 3P | 4P |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Acc. to IEC 60947.2 | Icu | $\leq 48 \mathrm{~V}$ | 6 kA | 6 kA |  |  |
|  |  | 110 V |  | 6 kA | 6 kA |  |
|  |  | 230 V |  |  |  | 10 kA |
|  | Ics ${ }^{(1)}$ | $\leq 48 \mathrm{~V}$ | 100 \% | 100 \% |  |  |
|  |  | 110 V |  | 100 \% | 100 \% |  |
|  |  | 230 V |  |  |  | 100 \% |

| DX $^{3} \mathbf{1 0 0 0 0}$ | voltage | single-pole | $\mathbf{2 P}$ | $\mathbf{3 P}$ | 4P |  |
| :--- | :--- | :---: | :---: | :---: | :---: | :---: |
| Acc. to <br> IEC 60947.2 | Icu | $\leq 48 \mathrm{~V}$ | 10 kA | 10 kA |  |  |
|  |  |  | 10 kA | 10 kA |  |  |
|  |  |  |  |  | 15 kA |  |
|  | $\boldsymbol{I c s}^{(1)}$ | $\leq 48 \mathrm{~V}$ | $100 \%$ | $100 \%$ |  |  |
|  |  |  | $100 \%$ | $100 \%$ |  |  |
|  |  |  |  |  | $100 \%$ |  |

## 1: As a \% of Icu

## 5 - Distribution of breaking poles

To choose the MCB and determine the pole distribution necessary for breaking on each of the polarities, it is necessary to know how the installation is earthed

## - Supply with one polarity earthed:

Place all the poles necessary for breaking on the other polarity If isolation is required, an additional pole must be added on the earthed polarity
MCB

1: Only if isolation required

## L7legrand

## Protection of DC circuits

## Protection of DC circuits

Example: circuit earthed via the negative polarity $/ \mathrm{U}=110 \mathrm{~V}=\mathrm{I} / \mathrm{lsc}=$ $10 \mathrm{kA} / \mathrm{In}=32 \mathrm{~A}$
Protect the positive polarity using an MCB capable of breaking 10 kA at 110 V ( $\mathrm{DX}^{3} 100002 \mathrm{P} 32 \mathrm{~A}$ with 2 poles on the positive polarity) For isolation, use a DX ${ }^{3} 100003 \mathrm{P} 32 \mathrm{~A}$ with 2 poles on the positive polarity and one pole on the negative polarity

- Network earthed via a middle point:

Place on each polarity the number of poles necessary for max. Isc breaking at half voltage

1: MCB (U/2-Isc max.)
Example: circuit earthed via a middle point $/ \mathrm{U}=230 \mathrm{~V}=/ \mathrm{Isxc}=6 \mathrm{kA}$ / $\mathrm{In}=10 \mathrm{~A}$
Protect each polarity using an MCB capable of breaking 6 kA at half voltage, i.e. 115 V

| DX ${ }^{3} 6000$ |  | voltage | single-pole | 2P | 3P | 4P |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Acc. to IEC 60947.2 | Icu | $\leq 48 \mathrm{~V}$ | 6 kA | 6 kA |  |  |
|  |  | 110 V |  | 6 kA | 6 kA |  |
|  |  | 230 V |  |  |  | 10 kA |

- Isolated earth supply:

Distribute the poles necessary for breaking over the 2 polarities to provide protection in the event of a double earth fault (particularly if there are a number of circuits in parallel)

1: MCB (U-Isc max.)

Example: isolated earth circuit / $\mathrm{U}=48 \mathrm{~V}=/ \mathrm{Isc}=4,5 \mathrm{kA} / \mathrm{In}=40 \mathrm{~A}$ Protect the installation with an MCB capable of breaking 4.5 kA at 48 V and protect each polarity

| DX $^{3} \mathbf{6 0 0 0}$ | voltage | single-pole | 2P | 3P | 4P |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
| Acc. to <br> IEC 60947.2 | Icu | $\leq 48 \mathrm{~V}$ | 6 kA | 6 kA |  |  |
|  |  |  | 6 kA | 6 kA |  |  |
|  |  |  |  |  | 10 kA |  |

## Functions

Select menu, go back while in menu
Press $>1$ sec. $=$ operating display
OK
Confirm the selection or accept the parameterSelect the menu item or set the parameter;
for 2-channel time switches, can be used
to select the channel (channel 1 - channel 2)

## Brief description of programming functions

## Text guidance

Guides the user through programming and setup with plain text prompts. Each step can be read on the screen, and the function that is currently active flashes. An integrated display and button light makes operation easy even in poorly lit environments.

## Set language

The language selection function can be accessed using the "MENU" button. The language is set to English by default.
The following languages can be selected: German, English, French, Italian, Spanish, Dutch, Portuguese*, Swedish*, Norwegian*, Finnish*, Danish*, Polish*, Czech*, Russian*, Turkish*.
*) Excluding AstroRex DY64

## Time, date, summer time (daylight saving time)

The time switch is preset at the factory to the current time and date. The time can be changed by selecting "MENU" + "SET".

AlphaRex ${ }^{3}$ D21s
AlphaRex ${ }^{3}$ D21 astro
AlphaRex ${ }^{3}$ DY21

## Reset

Simultaneously pressing all buttons for more than 2 seconds deletes all data. Language, date/time, summer time (daylight saving time) and switch times must be set again.

## Data key

If the supply voltage is switched on, the "KEY - READ - WRITE" menu item is automatically opened when a data key is inserted. "WRITE": Program data is written from the time switch to the key. Caution: Any data present on the key will be overwritten. "READ": Program data is written from the key to the time switch; any switching programs on the time switch are overwritten. Only one master switching program, which consists of multiple switching programs, can be saved on the time switch or on the key at a time. If the supply voltage is not connected, the "KEY - READ - WRITE" menu item is not automatically opened when a data key is inserted. The "KEY" function can still be selected from the menu even if the supply voltage is not connected.

## PC programming

In addition to the easy, text-guided programming directly on the time switch, switching programs can also be created on a PC with the software program from Legrand and transferred to the time switch using a data key. A data transfer device (Cat.No : 412873 ) is required to transfer switching programs created on a PC to the data key. The device is connected to the PC using the USB plug. In addition to the data transfer device, we also offer a CD with the software and the necessary drivers. PC system requirements: USB port; Windows ${ }^{\circledR}$ XP, Windows ${ }^{\circledR}$ Vista, Windows ${ }^{\circledR} 7$; approx. 40 MB of free memory.

## L7 legrand

## AlphaRex ${ }^{3}$ digital time switches

## Brief description of programming functions

## Weekly programs

To create a weekly program, select "MENU", "PROGRAM", and then "CREATE" to easily enter programs which are repeated on a weekly basis. A weekly program consists of a switch-on/switch-off times and days which are assigned as "switched-on" or "switched-off". The following predefined blocks can be selected: "MONDAY - SUNDAY", "MONDAY - FRIDAY" ${ }^{1)}$ or "SATURDAY - SUNDAY", "; the assigned days of the week are fixed. The switch-on/switch-off times must be entered. The user can also set custom day blocks. By selecting "CUSTOM", switch times can be freely assigned to any days of the week. This option also allows the user to set switch times at midnight.
${ }^{1)}$ Excluding AlphaRex ${ }^{3}$ DY, AstroRex DY64

## Yearly programs [AlphaRex ${ }^{3}$ DY21, AlphaRex ${ }^{3}$ DY22]

This menu item allows the user to enter (additional) yearly programs, which are only executed within a defined validity period. They can overlap with one another and with the weekly programs on the same channel based on an "OR" connective. The validity period is defined by entering the start date (at 00:00:00) and the end date (at 24:00:00). The start date must be entered before the end date. With the "EVERY YEAR" option, the additional switch times have the same validity period each year (Christmas, national holidays, birthdays, etc.) Select the "ONCE" option when additional switch times are needed within a validity period (e.g. during holidays), but the start/end dates of the holiday period change from year to year.

## Special programs (priority program) [AlphaRex ${ }^{3}$ DY21, AlphaRex ${ }^{3}$ DY22]

Weekly and yearly programs on the same channel are not executed during the validity period of a special program. However, other special programs can be executed during the validity period. Different special programs can overlap with each other based on an "OR" connective. With the "EVERY YEAR" option, the additional switch times have the same validity period each year (Christmas, national holidays, birthdays, etc.). Select the "ONCE" option when additional switch times are needed within a validity period (e.g. during holidays), but the start/end dates of the holiday period change from year to year. Additional options include "MON TO SUN"/"CUSTOM": the respective channel only switches according to the special program; "PROG ON"/"PROG OFF": the respective channel is switched on/off during this time period.

## Basic functions for "astro"

## Location (astro) [AlphaRex ${ }^{3}$ D21 astro, AlphaRex ${ }^{3}$ D22 astro, AlphaRex ${ }^{3}$ DY21, AlphaRex ${ }^{3}$ DY22]

The sunrise/sunset times, which change daily, are calculated for the location programmed in the AlphaRex. The unit is delivered with the location set to "GERMANY - SOEST" by default. Enter the actual location for optimal operation. This can be done in two ways. Select "MENU", "SET" and "ASTRO" to access the two options "LOCATION" and "COORDINATES". "LOCATION": With this menu item, the user can select the country and city which is closest to the site of operation. "COORDINATES": Alternatively, the user can select this menu item to set the geographical coordinates of the location. The longitude and latitude values are entered in degrees or degrees and arcminutes ${ }^{2)}$ (precision can be set in expert mode). Information on coordinates and time zones can be found in the time zone map included with every time switch.

## Offset

By selecting "MENU", "SET", "ASTRO" and "OFFSET", time differentials can be set for the calculated switch times. This can be done in two ways: time offset or angle offset.
In time offset, a time differential can be entered to shift the switch time by up to $+/-120$ min relative to the sunrise/sunset times.
In angle offset ${ }^{2}$, a value can be entered in degrees and arcminutes to shift the switch time by up to $+/-12^{\circ} 00^{\prime}$ relative to the sunrise/sunset times. The time differentials are set separately for sunrise and sunset using the menu items "SUNSET" (opens the screen for setting the sunset offset) and "SUNRISE" (opens the screen for setting the sunrise offset).

Example:
For a time differential of +30 min , the time switch switches 30 min . after sunrise and 30 min . after sunset
For a time differential of -30 min , the time switch switches 30 min . before sunrise and 30 min . before sunset.

Note:
If the offset is set in degrees, the time switch always switches at points when the brightness is the same, despite the fact that the twilight duration changes over the course of the year. Sunrise and sunset correspond to -50 ' for the centre of the sun (the edge of the sun is visible on the horizon).

## Offset correction function ${ }^{2)}$

Select "MENU", "SET", "ASTRO" and "CORRECTION" to set a time correction for the 6-month periods surrounding summer and winter. The time correction is set to 0 min . by default and can be set from 1 min . up to 30 min . The time correction for sunset is entered in the "SUNSET" menu item. The time correction for sunrise is set in the "SUNRISE" menu item. The correction function overlaps with the calculated astronomical switch times, including the offset settings.

## Example:

Setting a time correction extends the daily switched-on time by up to 60 min . in the middle of the six winter months (switches off up to 30 min. later in the morning and switches on up to 30 min . earlier in the evening). In the middle of the six summer months, the time correction reduces the daily switched-on time by up to 60 min . (switches off up to 30 min . earlier in the morning and switches on up to 30 min . later in the evening). The time correction varies continuously between the two max. values during the rest of the year.

## Basic settings using a PC and day key

All of the basic settings described above, with the exception of the current time and date, can be set up using the AlphaSoft software from Legrand and imported to the time switch using the data key. ${ }^{2)}$ Excluding AstroRex DY64

## AlphaRex ${ }^{3}$ digital time switches

## Additional functions

## Relay function

The relay state can be changed by selecting "MENU" and "FUNCTIONS". The relay is preset to the "AUTO" function; the time switch switches at the programmed times. The following can also be selected: "ALWAYS ON", "ALWAYS OFF" and "EXTRA". If "EXTRA" is selected, the switching status specified by the program is inverted. The time switch resumes switching according to the programmed switch times after the next switch command.

## Holiday program

In holiday program, the holiday period is set with a start and an end date. It can be activated with the "ACTIVE" program item and deactivated with "PASSIVE". If the holiday program is activated, the time switch does not carry out any programmed switch commands during this time period. Instead, it remains "ALWAYS OFF" or "ALWAYS ON" during the holiday period, as requested. When the holiday period has ended, the time switch resumes switching according to the programmed switch times.

## 1 h test

The " 1 h TEST" function can be used for a switching simulation. If " 1 h TEST" is activated, the switch outputs are switched for one hour. After the time has ended, the time switch resumes switching according to the programmed switch times.

## PIN code

Input and programming can be locked using a four-digit "PIN CODE". The time switch can be unlocked using the "PIN CODE". The time switch can also be unlocked using the "RESET" function, which also deletes all settings and programs.

## Operating hours counter

This function displays the time for which the relay has been switched on and the date of the last reset. Counting range: $65,535 \mathrm{~h}$.

## Contrast adjustment

This function allows the user to adjust the display contrast.

## Expert mode*

Expert mode is activated by selecting "OPTIONS" and "EXPERT". After expert mode is activated, the following additional functions can be used: control input "extra" ${ }^{1)}$, control input "out" ${ }^{11}$, cycle function, channel-switching function (2-channel time switches), mains-synchronous operation, offset correction function ${ }^{2)}$, geographical coordinates in degrees and arcminutes ${ }^{2)}$.
${ }^{\text {1) }}$ AlphaRex ${ }^{3}$ D21s, AlphaRex ${ }^{3}$ D21 astro, AlphaRex ${ }^{3}$ DY21 ${ }^{2)}$ AlphaRex ${ }^{3}$ astro, AlphaRex ${ }^{3}$ DY

## Control input with switch-off delay

Adjustable switch-off delay via control input. The control input enables an additional switching of the relay, parallel to the switching program. The switch-off delay can be set from 0 s to 23 h 59 min 59 s . The switch-off delay begins as soon as the voltage is removed from the control input.

## Control input "extra"*

Override of switching state via control input. If the "EXTRA" function is activated, the switching state specified by the program is inverted. The time switch resumes switching according to the programmed switch times after the next switch command. The "EXTRA" function is ended prematurely if the button is pressed again or if a pulse is received at the control input.

## Control input "off"*

Switch off via control input. Activating the "OFF" function causes the time switch to be switched off via the control input. The "OFF" function is ended if the button is pressed again or if a pulse is received at the control input. The time switch resumes switching on/off according to the programmed switch times.

## Pulse function

Programmable with precision to the second.

## Cycle function

Function for cyclical switching. With this function, the time switch is switched on once within a defined time period and for a defined duration. The cycle time can be set between 2 s and 2 h . The switch-on time can be set between 1 s and 1 h 59 min 59 s .

## Random function

If the random function is activated, set switch times are randomly shifted within a range of $+/-15$ minutes.

## Channel-switching function*

With 2-channel time switches, this function can be activated so that the time switch regularly switches between the outputs assigned to the channels, in order to protect connected devices (for example lights/lamps) or so that two devices can be used simultaneously.
The channel-switching function is activated by selecting "MENU", "OPTIONS" and "CHANNEL $1<>2$ ". The time switch switches between the outputs according to whether the menu item "DAILY" (once per day at 12:00 p.m.) or "WEEKLY" (once per week on Sunday at 12:00 p.m.) is selected.

## Mains-synchronous operation

Mains-synchronised clock precision. By activating the "SYNC" function and then "ACTIVE", the quartz-controlled time switch becomes a synchronous time switch.

## Surge Protective Devices (SPDs)

## protection against transient overvoltages

## Protection against lightning and overvoltages

Protection against the effects of lightning is essentially based on: - Protecting buildings using a lightning protection system (LPS or lightning conductors) to catch lightning strikes and to drive the lightning current to earth.

- The use of surge protective devices (SPDs) to protect equipment. - The design of the earthing system (passive protection of the installation).
Throughout the world, there are millions of lightning strikes each day in the summer (up to 1000 lightning strikes/second). Lightning is responsible for $25 \%$ to $40 \%$ of all damage to equipment. When added to industrial overvoltages (switching overvoltages due to the operation of internal equipment), they account for more than $60 \%$ of all electrical damages, which can be prevented by installing SPDs (according to the country and type of installation - source: insurance companies). In some countries, and depending on the end use of the building, national regulations may always stipulate the installation of SPDs (for example, Germany, Austria, Norway, etc.). If there are no specific national regulations, SPDs are usually specified by national installation standards (based on HD/IEC 60364 international installation standards) and EN/IEC 62305 standards.

External lightning protection system (LPS) or lightning conductors: protection of buildings (EN/IEC 62305)
An external lightning protection system (LPS) protects buildings against direct lightning strikes. It is generally based on the use of lightning conductors (single rod, with sparkover device, meshed cage etc.) and/or the metallic structure of the building.
If there is an LPS or if a lightning risk assessment has been carried out in accordance with EN/IEC 62305 standards, SPDs are generally required in the main distribution board (T1 SPDs) and distribution boards (T2 SPDs).
Determination of the SPDs in the main distribution board in accordance with EN/IEC 62305 and TS/IEC 61643-12 (if there is insufficient information available):

| LPL': Lightning <br> protection level | Total lightning <br> current of the LPS | Min. value of Imp <br> current of the SPD (T1) | Usage practices |
| :---: | :---: | :---: | :---: |
| I | 200 kA | $25 \mathrm{kA} / \mathrm{pole}$ <br> (IT: $35 \mathrm{kA} \mathrm{min)}$. | Power installations |
| II | 150 kA | $18.5 \mathrm{kA} /$ pole | Rarely used |
| III/IV | 100 kA | $12.5 \mathrm{kA} /$ pole | Small installations |

1: LPL (Lightning Protection Level)

## Surge protective device (SPD) (internal protection)

The SPD

- Protects sensitive devices against overvoltages caused by lightning and industrial overvoltages, by limiting the overvoltages to values that are tolerated by the equipment
- Limits the possible harmful consequences in terms of the safety of people (medical equipment installed in the home, security systems, environmental systems, etc.)
- Maximises the continuity of operation of equipment and limits production losses

## SPDs and standards

Standards EN/IEC 61643-11

| Type of SPD |  | Test waves |
| :--- | :--- | :--- |
| EN 61643-11 | IEC 61643-11 |  |
| Type 1 (T1) | Class I (T1) | limp: $10 / 350 \mu \mathrm{~s}$ (discharge current) <br> In: $8 / 20 \mu \mathrm{~s}$ (nominal current, 15 shocks) |
| Type 2 (T2) | Class II (T2) | Imax: $8 / 20 \mu \mathrm{~s}$ (discharge current) <br> In: $8 / 20 \mu \mathrm{~s}$ (nominal current, 15 shocks) |

T1+T2 SPDs: tested in accordance with both methods.
T1 or T1+T2 SPDs are being increasingly used at the supply origin of installations, even when there is no lightning conductor, as they enable higher energies to be discharged and increase the service life the SPD.

## HD/IEC 60364 electrical installation standards

According to articles 443 and 534 of HD/IEC 60364 standards and the TS/IEC 61643-12 guides, the use of SPDs in new or renovated buildings is compulsory at the supply origin of the installation in the following cases:

- Buildings with lightning conductors (T1 SPDs, limp $\geq 12.5 \mathrm{kA}$ )
- Buildings with totally or partially overhead power supplies in AQ2 geographical areas (article 443.3.2.1-AQ2: Nk > 25, see map below) and based on a risk assessment taking into account the type of power supply to the building (article 443.3.2.2)

According to article 443.3.2.2, SPDs (Type 2) are also required in the following cases:

- Commercial/industrial buildings, public buildings and services,
religious buildings, schools and large residential complexes, etc.
- Hospitals and buildings containing medical equipment and/or security
systems for people and property (fire alarm, technical alarms, etc.)
Important: it is advisable to install an SPD when the safety of people may depend on the continuity of service of equipment (even if this is not required by national standards). Although not compulsory according to the installation standards, an SPD should always be installed to protect the communication equipment when there is an SPD on the low voltage power network.
These rules should change in 2015. Please consult Legrand.

Protection of distribution boards and sensitive equipment (cascaded protection)

Effective protection against overvoltages cannot generally be assured with a single SPD if its protection level (Up) is greater than 1.2 kV (EN/IEC 62305 and TS/IEC 61643-12).
When there are overvoltages, an SPD protects equipment by limiting these overvoltages to values that can be tolerated by the equipment. Thus, depending on its discharge capacity (discharge current In, Imax, etc.) and its protection level (Up), an SPD will limit these overvoltages to varying values depending on the energy levels involved. The overvoltage values that may be transmitted downstream of the SPD may double over distances of more than 10 m due to resonances associated with the type of electrical installation and the type of equipment. Overvoltages greater than 2.5 kV may then occur and damage equipment if the residual energy is high enough ( 2.5 kV being the insulation level of most electrical and electronic equipment, or typically 1.5 kV for electrical domestic appliances).
SPDs should be installed in the distribution boards supplying equipment that is sensitive or critical for the activity being carried out (and/or near to equipment with proximity SPDs).

| :--- | :---: | :---: |
| Uc | 200 V |  |
| Up | 600 V |  |
| Imax | 1.5 kA |  |
| In | 1 kA |  |
| Uoc | 3 kV |  |

TV protection ( 9.5 mm coax.)

| Cat. No. | $\mathbf{6 9 4 6} \mathbf{6 6}$ |
| :--- | :---: |
| Uc | 50 V |
| Up | 900 V |
| Imax | 5 kA |
| In | 1 kA |
| Uoc | 3 kV |

## L7legrand

## Surge Protective Devices (SPDs)

## technical characteristics

## Installation

## Associated overcurrent protection

SPDs must be protected by a circuit breaker (or fuses), to provide protection in the event of an overload, which may make the SPD reach its end of life (see selection table p. 10-11). This protective device will be defined to be coordinated or discriminating with regard to upstream protective devices.

## Connection principles <br>  <br> Main terminal block for protective <br> conductors or earthing bar (PE)

Connection lengths: as short as possible (< 50 cm if possible).
EMC (Electromagnetic Compatibility) rules: avoid loops, fix the cables firmly against the exposed metal conductive parts of the enlcosure.

## SPD types and earthing systems

When possible (according to local rules), the SPD and its associated overcurrent protection (P2) should be installed upstream of the main protection (P1) as shown below (according to standards HD/IEC 60364).

## SPDs and TT earthing system

P1: main protection of the installation
SPD: surge protective device with Uc 275 or 320 V recommended
(1) (upstream of P1): $1 \mathrm{P}+\mathrm{N} / 3 \mathrm{P}+\mathrm{N}$ SPDs only (except for Cat.Nos 0039 51/53/71/73).
1P/2P/3P/4P SPDs and Cat.Nos 0039 51/53/71/73 must always be installed downstream of a residual current device (discriminating or delayed, at the supply end of the installation).
(2) (downstream of P2): any SPD.

SPDs and TN (TNC, TNS and TNC-S) earthing systems

P1: main protection of the installation
SPD: surge protective device with Uc 275 or 320 V recommended

## SPDs and IT earthing system

P1: main protection of the installation
SPD: surge protective device with Uc 440 V (Uc < 440 V prohibited)

Coordinating upstream/downstream SPDs
Consists of ensuring that any downstream SPD (in distribution enclosures or proximity SPDs) is correctly coordinated in energy terms with any SPD located upstream (TS 61643-12).

## Minimum distances between SPDs

| Upstream SPD | Downstream SPD | Min. distance (m) |
| :--- | :--- | :---: |
| T1/50 and T1/25 | T2/40 | 10 |
| T1/12.5 and T1/8 | T2/40 | 6 |
|  | T2/20, T2/12 | 8 |
| T2/40 | T2/20 | 4 |
|  | T2/12 | 6 |
| T2/20 and T2/12 | Proximity SPD | 2 |

If it is not possible to comply with these distances, insert decoupling inductors on each phase and neutral conductor.

NOTES

## Head office

1. $61 \& 62$, 6 th Floor,

Kalpataru Square, Kondivita Road, Off Andheri-Kurla Road, Andheri (E),
MUMBAI - 400059.
Tel : (022) 30416200
Fax : (022) 30416201
Website : www.legrand.co.in

## Regional sales offices

2. A-25, Mohan Co-operative Industrial Estate, Mathura Road,
NEW DELHI - 110044
Tel : (011) 26990028 / 29 / 30, 39902200 Fax : (011) 26990047
3. Bhakta Towers, 2nd \& 3rd Floor, Plot No. KB 22, Salt Lake, Sector - 3, KOLKATA - 700098. Tel : (033) 40213535 / 36 Fax : (033) 40213537
4. 34, 3rd Floor, Kalpataru Square, Kondivita Road, Off Andheri-Kurla Road, Andheri (East),
MUMBAI - 400059.
Tel : (O22) 33856200
Fax : (022) 33856201
5. Gee Gee Universal,

8th Floor, Door No. 2, 18/1 \& 18/2, McNichols Road, Chetput, CHENNAI - 600031.
Tel : (044) 3024 7200, 28364165 / 67 / 68 Fax: (044) 28364169
6. 205-208, 2nd Floor, Block - II, White House, Kundan Bagh, Begumpet, HYDERABAD - 500016.
Tel : (040) 23414398 / 67, 45671717
Fax : (040) 66366974

## Branch offices

7. SCO 1-2-3,

Second Floor, Sector 17B,
CHANDIGARH - 160017.
Tel : (0172) 3058631 / 32 / 33 / 34 / 35
Fax : (0172) 5019008
8. 507-510, Vth Floor, Soni Paris Point, Jai Singh Highway, Banipark,
JAIPUR - 302016.
Telefax : (0141) 5113129
9. 504, Sakar IV,

Opp. M. J. Library, Ellis Bridge,
AHMEDABAD - 380 006. Gujarat
Tel : (079) 26586561 / 2
Fax : (079) 26586563
